main functions of models of biological systems, and this topic therefore takes up the greatest part of the text. The third section covers techniques for fitting model parameters to experimental data. Given a data set and a class of models, the goal will be to find the best model from the class to fit the data.

BIOLOGICAL MODELING AND SIMULATION - Semantic Scholar
This essay provides an introduction to the terminology, concepts, methods, and challenges of image-based modeling in biology. Image-based modeling and simulation aims at using systematic, quantitative image data to build predictive models of biological systems that can be simulated with a computer.

Modeling and simulation of biological systems from image data
StochSS is an integrated development environment for modeling and simulation of discrete stochastic biochemical systems. An easy to use GUI enables researchers to quickly develop and simulate biological models on a desktop or laptop, which can then be expanded or combined to incorporate increasing levels of complexity.
Models in ecotoxicology. The purpose of models in ecotoxicology is the understanding, simulation and prediction of effects caused by toxicants in the environment. Most current models describe effects on one of many different levels of biological organization (e.g. organisms or populations).

Agent-based modeling and simulation is a powerful technique in simulating and exploring phenomena that includes a large set of active components represented by agents. The agents are actors operating in a real system, influencing the simulated environment and influenced by the simulated environment. The agents are included in the simulation model as model components performing actions ...
